

 <p>Agreement on the Conservation of Albatrosses and Petrels</p>	<p><b>Tenth Meeting of the Advisory Committee</b> <i>Wellington, New Zealand, 11 – 15 September 2017</i></p> <p><b>Choice of a standard taxonomy for ACAP</b></p> <p><b>Taxonomy Working Group</b></p>
---	--

## SUMMARY

The Taxonomy Working Group (TWG) was asked by Advisory Committee following the 5<sup>th</sup> session of the Meeting of Parties to recommend a standard taxonomy to be used when considering new species for Annex 1 of ACAP and for other ACAP purposes (see Action 1.5 of Resolution 5.4 Appendix A - Advisory Committee Work Programme 2016 – 2018). There are four main possible global ornithological taxonomies that all differ slightly in their treatment of albatrosses and petrels. TWG recommends the use of the International Ornithological Congress (IOC) listing based on its use of the widest evidence base and peer reviewed process. TWG continues to support the taxonomic treatment used currently by ACAP in Annex 1. TWG recommends deletion of the synonym *Puffinus creatopus* in Annex 1 of the Agreement.

## RECOMMENDATIONS

The Taxonomy Working Group recommends that:

1. ACAP adopts the taxonomy supported by the International Ornithological Congress. Should Parties bring forward a new taxon for listing under Annex 1, the latest version of the IOC taxonomy initially should be used and the version number be clearly noted. The current mechanisms to consider proposals for new species are not affected, neither is the existing ACAP taxonomy.
2. Annex 1 be amended to remove the *Puffinus creatopus* synonym, leaving only Pink-footed Shearwater *Ardenna creatopus* for that species.
3. No other change be made to Annex 1 as a consequence of the above taxonomic choice.

## 1. GLOBAL TAXONOMIES

### 1.1. International Ornithological Congress (IOC) list

Gill and Donsker (2017) has the advantage of having been agreed by a wide range of taxonomists working under the sponsorship of the International Ornithological Congress - and very often follows the recommendation of regional or continental expert groups. This though has the disadvantage of a slightly greater level of inconsistency of treatment across groups, and IOC can sometimes be a little slow in adopting new understanding. It is widely used across academic literature and is updated approximately quarterly. The list is available online at <http://www.worldbirdnames.org/>.

### 1.2. Clements (or Cornell) list

Clements et al. (2016) was developed many years ago and has been inherited and updated by Cornell University. There is some greater consistency in approach than perhaps IOC and is more conservative but updating is slower than IOC. The list is used by eBird (an online database of bird observations) globally and is updated annually. The list is available online at <http://www.birds.cornell.edu/clementschecklist/download/>.

### 1.3. Howard and Moore list

Dickinson and Remsen (2013) is an update of an earlier list that was also the starting point for the IOC list. It has been intermittently kept up to date using a panel of experts and is relatively consistent in its treatments. It is not widely used and is not available online.

### 1.4 Handbook of the Birds of the World/Birdlife International list

Del Hoyo and Collar (2014) is a relative newcomer and was born out of a frustration at the speed with which other lists were resolving taxonomic debates at the species level. It has endeavoured to apply a novel standard way of separating taxa at a species level using scores of various features. The applications of this standard approach have not been formally peer reviewed and the review of decisions instead relies on feedback from online users. A range of experts have led on separate bird families (but only one expert for albatrosses and petrels). The list does not use molecular evidence in primary decision making. The list has been adopted as a standard by the Convention on Migratory Species (CMS), two of CMS's daughter agreements and by IUCN. There is an updating process. The list is available at <http://www.hbw.com>.

## 2. TREATMENT OF ALBATROSSES AND PETRELS

The four world bird lists differ slightly in their primary goals and taxonomic philosophy. Improved alignment of the taxonomic works is a goal of the newly structured International Ornithologists Union, including a Round Table discussion planned for the 2018 meeting in Vancouver, British Columbia.

**ANNEX 1** compares the treatment of the albatrosses and petrels by each of the four taxonomies. Only the Handbook of the Birds of the World/Birdlife International list uses ACAP's taxonomy for ACAP species, but this is with the caveat that our treatment at present would not survive their standard approach and our listing is adopted "provisionally and precautionarily".

As can be seen in **ANNEX 1**, there are not great differences between the treatments. The differences at species level fall into four categories:

1. “New” species discovered since the publication of the list (e.g. Pincoya Storm-petrel)
2. Disagreement as to whether a taxon should be considered a species or a subspecies
3. Disagreement as to whether fourteen Storm-petrel species should have the generic name *Oceanodroma* or *Hydrobates*
4. Disagreement as to whether one (extinct) taxon should be classified as a *Pterodroma* or a *Pseudobulweria*

### **3. CHOICE BETWEEN THE LISTS**

TWG considers that any standard taxonomy used by ACAP should:

1. Use a consistent scientific approach to taxonomic decisions, including higher level systematics.
2. Use a transparent system in which the scientific rationale for taxonomic decisions is clearly articulated, and is available online.
3. Use all available peer-reviewed evidence (including molecular) systematically.
4. Be reviewed and updated frequently to keep pace with scientific developments, new studies and new information.

This implies that ACAP should use best practice methodology rather than getting any particular desired outcome. TWG was not influenced by the choice or spelling of English (or any other language) names: the binomial Latin name is the appropriate basis for consideration of scientific species lists.

	Scientific approach	Transparent	All evidence	Frequency of review
IOC	X	X	X	X
Clements	X	X	X	X
Howard and Moore	X		X	
HBW/BLI	X	X		X

TWG evaluated each of the four taxonomies on the basis of the criteria described above. The Howard and Moore list is not available online and has not been reviewed recently. The methodology underlying the Handbook of the Birds of the World/Birdlife International list does not include molecular information (this information has been included later). The IOC and Clements lists score equally on the basis of our criteria, but the IOC list is reviewed by a wider base of expertise and is updated more frequently. The commitment by the Clements and IOC processes too converge to a single global taxonomy should also be noted.

On this basis, TWG recommends adoption of the IOC list by ACAP for the listing of new species to Annex 1 of the Agreement, and for other less formal purposes. TWG notes that this recommendation does not apply to the existing taxonomic treatment used by ACAP in Annex 1 with one exception. At present Pink-footed Shearwater is listed with two synonyms, *Ardenna creatopus* and *Puffinus creatopus*. Since all taxonomies examined now use *Ardenna creatopus*, TWG recommends deletion of the *Puffinus creatopus* synonym.
